

Algorithm

An algorithm is any well defined computational procedure that takes some value / a set of values as input and produces some value / a set of values as output.

$\text{Max}(a_1, a_2, \dots, a_n)$

largest = a_1 ————— const.

for $i = 2$ to n ————— $n-1$ times $\underbrace{\quad}_{\text{Q}} \cdot$

if $a_i > \text{largest}$ ————— const.

largest = a_i ————— const.

Count the number of basic operations.

Return largest, ————— const.

Total # operations: const. + $n-1 * \text{const.} + \text{const.} \cdot \cdot \cdot$

$$= n-1 * \text{const.}$$

$$\approx \text{const. } n$$

Integer multiplication

Given two numbers x and y
both are n digit numbers

compute $x * y$

Assumption: allowed only single digit addition or
multiplication.

Ex^m

$$x = \begin{matrix} 5 & 6 & 7 & 8 \end{matrix}$$

$$y = \begin{matrix} 1 & 2 & 3 & 4 \end{matrix}$$

$$\begin{array}{ccccccccc}
 & 5 & 6 & 7 & 8 \\
 \times & 1 & 2 & 3 & 4 \\
 \hline
 & 2 & 2 & 7 & 1 & 2 \\
 \rightarrow & 1 & 7 & 0 & 3 & 4 & - \\
 \rightarrow & 1 & 1 & 3 & 5 & 6 & - & - \\
 \rightarrow & 5 & 6 & 7 & 8 & - & - & - \\
 \hline
 & 7 & 0 & 0 & 6 & 6 & 5 & 2
 \end{array}$$

Q: How many operations are performed?
 in terms of n

Each row computation: const. * n // const. n^r
rows : n

Adding any two rows : const. * n // const. $n \times n - 1$
pair addition : $n - 1$

Total time: const. n^2

($c \cdot n \times n - 1$)
 $c n^r - c n$
 $\leq c n^r - d n^r$

Q: Can we do better?

$$10^{-2} \leq 10^{-5}$$

$$c^8 \quad d^5$$

A new problem

Integer addition

Given 2 numbers x and y

compute $x + y$

$$\begin{array}{cccc} \textcircled{1} & \textcircled{1} \\ 5 & 6 & 7 & 8 \\ + & 1 & 2 & 3 & 4 \\ \hline 6 & 9 & 1 & 2 \end{array}$$

Q. How many operations are performed?

Ans constant $\times n$

$$x = \begin{matrix} 5 & 6 \\ \underbrace{\quad}_{a} & \underbrace{7 & 8}_{b} \end{matrix}$$

$$y = \begin{matrix} 1 & 2 \\ \underbrace{\quad}_{c} & \underbrace{3 & 4}_{d} \end{matrix}$$

for general n

Step 1: compute $a \cdot c$ ————— 672

Step 2: compute $b \cdot d$ ————— 2652

Step 3: compute $(a+b) \cdot (c+d)$ ————— 6164

Step 4: Step 3 - Step 1 - Step 2 ————— 2840

Step 5: 10^n Step 1 + $10^{n/2}$ Step 4 + Step 2 ————— 7006652

$$x = 5 \text{ } 6 \text{ } 7 \text{ } 8 = 56 \times 10^2 + 78$$

$$x = 10^{\frac{n}{2}}a + b$$

$$y = 10^{\frac{n}{2}}c + d$$

$$x * y = (10^{\frac{n}{2}}a + b) (10^{\frac{n}{2}}c + d)$$

When n is odd

Pseudocode

$T(n)$

$\text{mul}(x, y)$

if $n=1$ return $x * y$

$a, b = \text{first and second half of } x$ — const. n

$c, d = \dots \dots 'y'$ — const. n .

$\text{tmp1} = \text{mul}(a, c) \longrightarrow T(n/2)$

$\text{tmp2} = \text{mul}(b, d) \longrightarrow T(n/2)$

$\text{tmp3} = (a+b)$ — const. n

$\text{tmp4} = c+d$ — const. n

$\text{tmp5} = \text{mul}(\text{tmp3}, \text{tmp4}) \longrightarrow T(n/2)$

$\text{tmp6} = \text{tmp5} - \text{tmp1} - \text{tmp2}$ — const. $\times n$

$\text{tmp7} = 10^n \text{tmp1} + 10^{n/2} \text{tmp6} + \text{tmp2}$ — const. $\times n$

return tmp7 — const.

operations

Total time

$T(n) = 3T(n/2) + \text{const.}$

Primary school method: $\text{const. } n^2$

This method: $T(n) = 3 + \binom{n}{2} + \text{const. } n$.

Q:1 How to simplify 2nd type of equation.

Q:2 How to compare running time of two different algorithms.
